Trends in mental health diagnosis and use of resources in Europe during the COVID-19 pandemic

Carmen Rodríguez-Blázquez, Cesar Garriga, M João Forjaz (ISCIII, Spain)

and the PHIRI – Use Case D Project team

www.phiri.eu

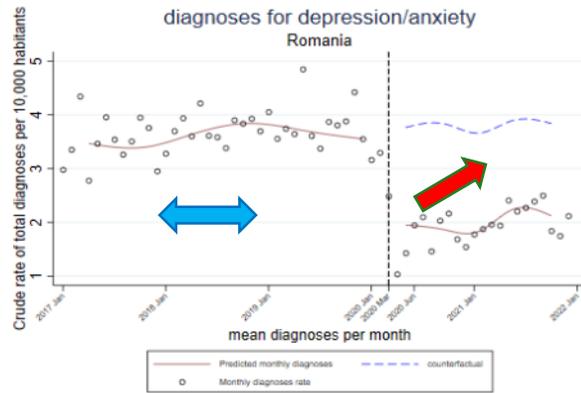

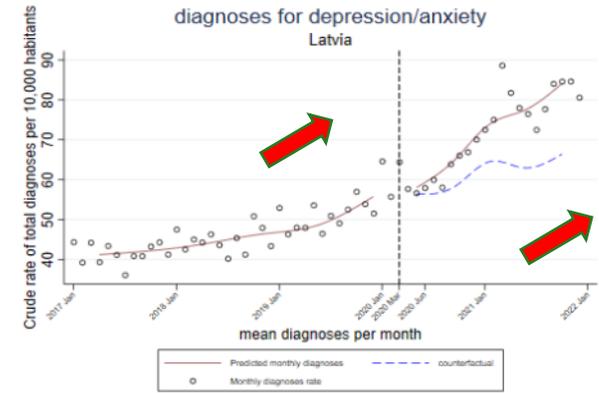

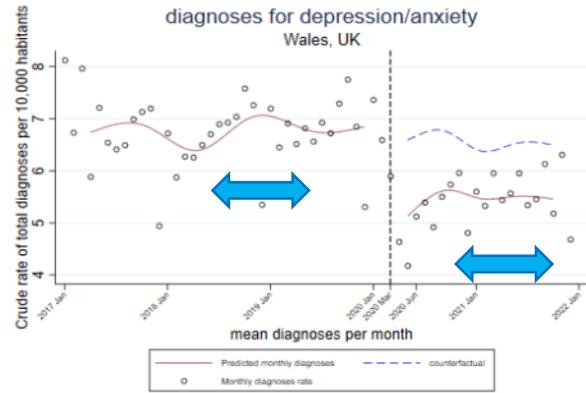

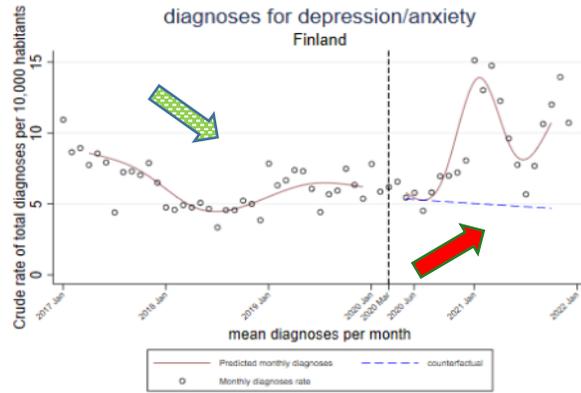

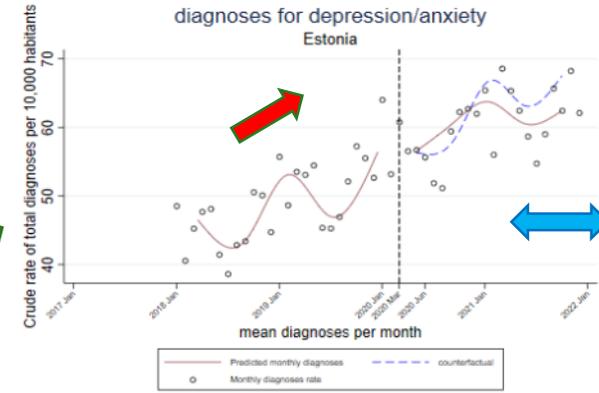

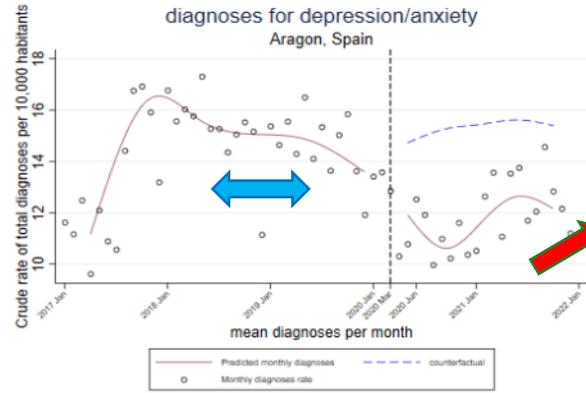

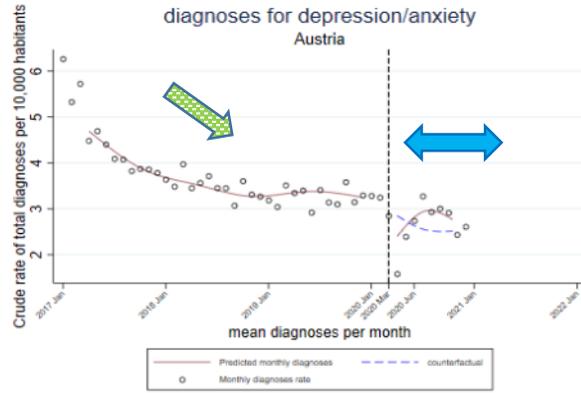

Background

- The **European Population Health Information Research Infrastructure (PHIRI)** conducted research through **use cases** of applicability for public health policies during the COVID-19 pandemic.
- The **aim** of this study is to show the impact in diagnosis of depression or anxiety and the use of health services due to the COVID-19 crisis.

Methods

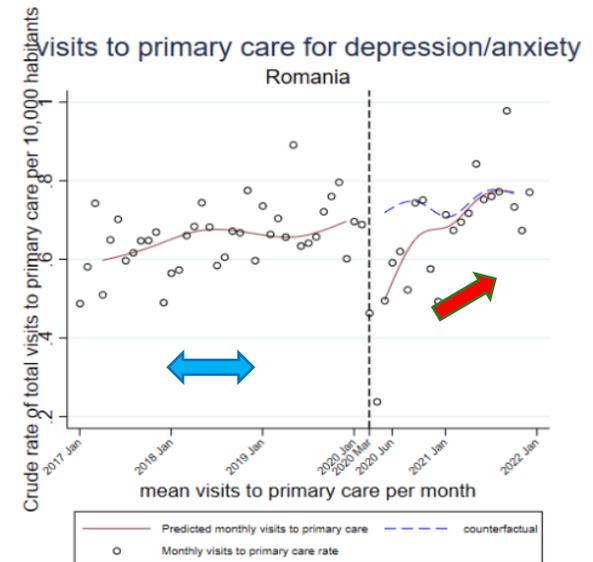

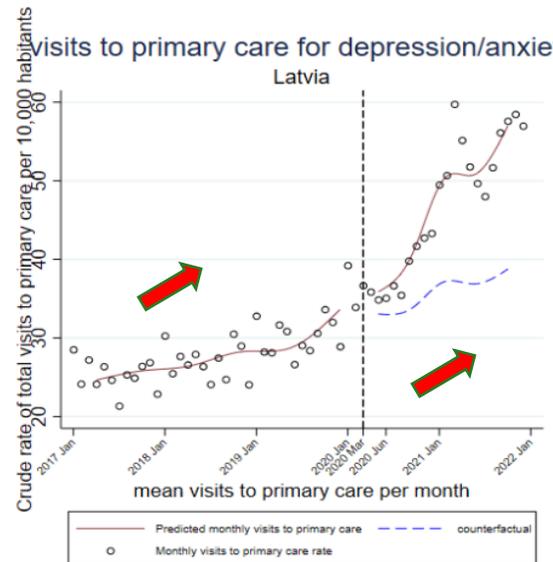

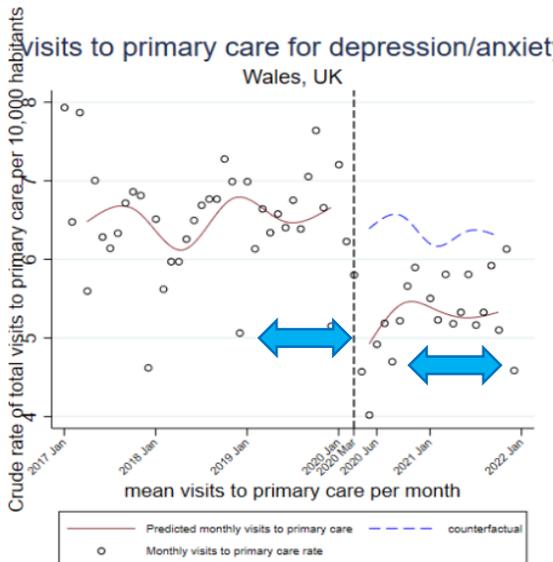

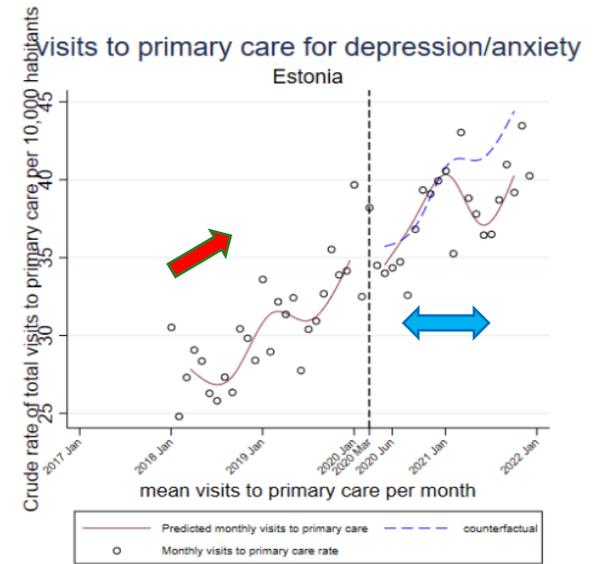

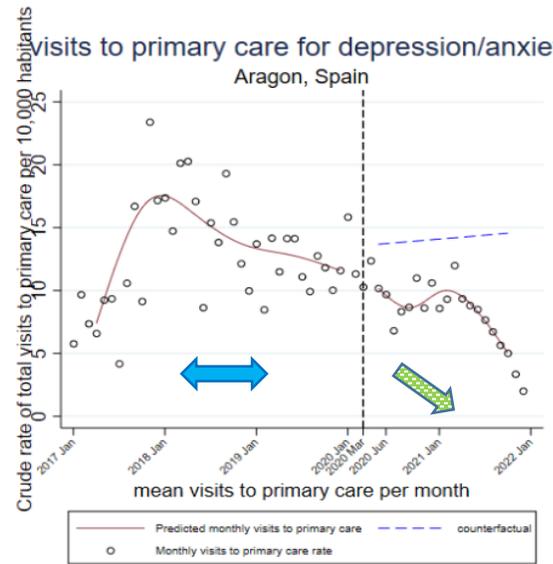

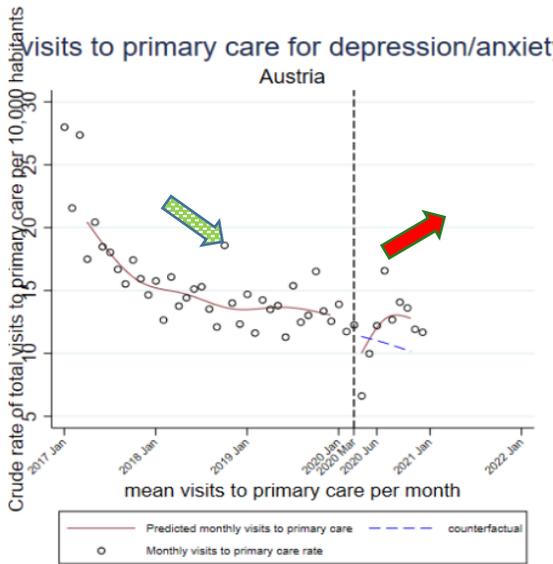

- A **common data model** was defined to collect aggregated data in the same format for all participating countries (datahubs).
- Aggregated datasets with the **total number of diagnosis of depression or anxiety** (ICD10: F30-F39 and F40-F48 codes) and the **number of visits to primary care** were generated.
- Diagnoses were obtained from **electronic health records**, using the PHIRI federated research infrastructure.
- **Incident trends** were depicted by month and year of visit (2017 and 2020).

Diagnoses of depression or anxiety

-  Decreasing trend
-  Increasing trend
-  Stable trend

Visits to primary care due to diagnoses of depression/anxiety

-  Decreasing trend
-  Increasing trend
-  Stable trend

Conclusions

- Despite differences in the European health systems, a **slight impact on COVID-19 on mental health diagnoses and resource use** could be detected.
- This study highlights the **usefulness of harmonized data** for providing evidence for future pandemic preparedness, but also identifies the **difficulties**.
- It is necessary to advance in the **elimination of barriers** for accessing data and to improve the **harmonization and homogenization of data** to allow comparability between countries and the practical use of the results.
- Future analyses:
 - Data disaggregated by sex, age, SES
 - Include other datahubs
 - Specific analyses by country
